## VOconnect

National Metro IP Carrier Network

NeTrec has formed a strategic partnership with VOConnect for all your connectivity needs

- NeTrec formed a strategic partnership with VOConnect.

- VOConnect is a next-generation communication and cloud computing service provider to the South African Market.

- VOConnect is totally ICASA compliant and operates in the 8ghz, 10.5ghz, and 23ghz licensed microwave wireless spectrum range.

- VOConnect has national coverage, which enables them to provide connectivity to most parts of Southern Africa.

- Services include: Managed Connectivity Services, Business MPLS VPN Services, Network and SLA Reporting Services on both Microwave and Fibre.

An architectural depiction of the VOConnect managed service environment

- VOConnect has a Microwave wireless network, allowing for quick installation and access to a reliable high speed network, which is not dependent on neither Telkom nor civils to implement.

- No cables required under ground, instead radio links (or aerials) on top of your building, connects your company to VOConnect High Speed wireless Microwave network.

- The frequency VOCOnnect transmit on is LICENSED with ICASA. There are many smaller service providers out there with unlicensed radio links running on a SHARED, UNLICENCED frequency called the ISM band.

- UNLICENCED wireless means anyone can use it and it's prone to becoming congested, has interference and results in degraded speed & services, slowing down internet access, mail and applications.

- **MPLS VPN point to point links**: What we offer is what you get. If you request 10Mbps, we dedicate that access to you and we provide a 1:1 contention, which means that you receive 10 Mbps (unshared). Many companies will present a cheap offering, but you share that access with a multitude of others.

- **Internet connectivity links**: Works on a 1:3 contention ration.

- VOConnect will not shape or throttle your bandwidth usage and provide uncapped, high quality premium access.

- VO provides extensive real-time network monitoring, providing for alerts and network performance visibility.

- VO provides security on the Network through firewalls by creating a dedicated channel of communication for your company on our network. This is called an MPLS VPN and provides a secure path and link on their network for related services offered.

- Stand-alone internet breakout type links are also offered by VOConnect.

- We believe that our clients will experience numerous benefits by utilizing the VOConnect infrastructure:
- Careful evaluation and constant monitoring of networks ensures that VOConnect is on the cutting edge of their industry.
- VOConnect is not locked into any external telecommunications infrastructure and continually benchmarks the industry on cost, service delivery and technology, passing this benefit to clients.
- VOConnect has a strong ethos in terms of customer service excellence and superior service delivery. While most large service providers have mature systems and processes, they often lack in customer service.
